Module Manual M.Sc. Econometrics

Date: July 10, 2024

Please note that you must contact us before the start of the semester (till March 15 for the upcoming summer term and till September 15 for the upcoming winter term) if you wish to take courses that may be relevant to the Master's degree program but are not listed in the module handbook. Please contact Daniel.dzikowski@tu-dortmund.de in this regard.

Overview of the program:

NAME		Courses	Credit Points
STATISTICAL THEORY	ME1a	Statistical Theory	10
ASYMPTOTIC THEORY	ME1b	Asymptotic Theory	5
ECONOMETRICS	ME2	Econometrics	9
CASE STUDIES	ME3	Case Studies	8
TIME SERIES ANALYSIS	ME4	Time Series Analysis	10
COMPULSORY ELECTIVES:			48
ECONOMICS	ME5	Different courses	11-26
APPLIED ECONOMETRICS	ME6	Different courses	11-26
ECONOMETRIC METHODS	ME7	Different courses	11-26
MASTER THESIS	ME8	Master Thesis	30

Preliminary remarks

Many of the modules to be described below sharpen students' general skills such as presenting work, programming etc. To avoid redundancies in the module descriptions, we sketch such broad skills here. Aspects that are specific to individual modules will be presented in the corresponding descriptions. The overarching goal of the Master of Econometrics is to train students in applying and developing methods to suitably model and analyze complex problems involving economic data. Students are not just to apply modern statistical techniques in a cookbook manner, but to thoroughly understand their common foundations and relationships. Only then, we believe, will they be able to make meaningful contributions to both econometric methodology and applications.

Like with most learning goals, but certainly like with any quantitative technique, understanding of econometric methods cannot be achieved through repetitive memorizing. Likewise, while lectures are a useful starting point to introduce new topics, learning ultimately must be an active act rather than only passive consumption of a lecture. Such understanding therefore should be and will be fostered through steady and extensive active work on exercises and concrete applications. Regular tutorials hence are a core and crucial part of the program. Consequently, all of our modules complement lectures (if any) with such exercise sessions.

Next to a deeper understanding of the course material, such tutorials also provide students with effective learning and research strategies. First, experienced PhD students, post docs and professors share their tested approaches to solving complex problems. Second, students come to appreciate that working through concrete problems is an effective way to foster their grasp of different methodologies. Third, writing down their solutions develops students' skills in formulating mathematical, statistical and econometric relationships, as well as, fourth, verbal and written communication skills more generally.

The importance of such exercises is reflected in regular due dates for suitable problem sets. Meeting such compulsory deadlines helps students develop time management skills and a steady work routine. At the same time, the corrected exercises provide students with timely feedback to what extent their learning progress is in line with the progression of the corresponding course. We are therefore convinced that successfully completed problem sets are to be rewarded, and likewise believe that failure to submit such exercises should be sanctioned.

The study regulations aim for different types of assessments so as to reflect the variety of tasks a successful econometrician needs to fulfil in his or her later career. Specifically, students can acquire credits, next to the problem sets described above, through, e.g., oral presentations, term papers and oral exams. These train students' written and oral communication skills. Written exams ask students to actively apply the methods discussed in the various modules.

Modern statistical and econometric work is inconceivable without hands-on application of the methods in statistical computing languages such as R. Our assessments will therefore also regularly ask students to demonstrate that they know how to translate abstract methodology to real-world applications using real data.

Finally, econometric (like most other) research ultimately flourishes most when done, shared and communicated with others. We therefore provide students with regular opportunities to work in groups, e.g. asking them to jointly discuss a suitable line of attack to an empirical problem. Similarly, peer-learning formats help students develop and support each other.

A semester abroad also serves to develop such general, interdisciplinary skills. Students are encouraged to take some courses at a foreign partner university. In particular, the 3rd semester is suitable in this regard. Such international exchanges are for example supported by the ERASMUS programme.

	English Contents of the module The Statistical Theory module covers the main topics of basic statistical theory and consists of the two blocks 'Probability Theory' and 'Decision Theory'. The block 'Probability Theory' gives an introduction to measure theory and stochastics necessary to formalize the questions discussed in statistical theory. The block 'Decision Theory' introduces the basic concepts associated with statistical tests. Possible topics include: decision rules, Bayes estimator, exponential families, the Neyman-Pearson lemma, two-tailed tests, Wald-tests, conditional tests, sequential hypothesis testing.

Compulsory Elective Courses

The set of compulsory electives is subject to change over time. We will react to new developments in econometrics through suitable additions to the current list of compulsory electives. At the same time, changes in the composition of the program's faculty through, e.g., new hires or retirements will be reflected in the course offerings. In particular, new teaching staff will contribute new expertise. **Also note that some compulsory electives may be credited for more than one block (ME5-ME7)**

Block ME5 (Economics)

		Seminar	in Advanced Intern	ational Trade	Э	S		5		150 h
2	Language English									
3	Contents of the module The seminar deals with different core topics in the area of international trade. It combines theoretical and empirical perspectives. For instance, the seminar deals with firm behavior on global markets, global value chains, trade policy or the nexus between trade and labor markets. Competences									
4	Competences The seminar will deal with major issues in international trade. By enrolling in this seminar, students can broaden and employ their theoretical and econometrics knowledge to this subfield of economics.									
5	Examinations The final module examination consists of a written seminar paper. An additional course achievement can be accomplished in the form of an oral presentation of the seminar paper, for which bonus points can be earned. A maximum of 75 points can be earned for the seminar paper, and a maximum of 25 points for the presentation. The module score then results from a scale of points ranging from zero to 100 points. The bonus points will also be credited of the module finale examination would not have been passed without the bonus points.

4	The seminar focusses on the interplay between politics, the market and the media. Which economic policy issues rise to the top of the public agenda, and which ones don't? Which ones are being prioritized, and which ones neglected? Whose interests are highlighted, and whose are largely ignored? Studying these questions may be just a sideshow in standard economics. However, they are at the core of the practical conduct of economic policy. The seminar offers concepts to systematically evaluate current policy issues and their public perception. Special attention is devoted to the news media, who play an outsized role in setting the economic policy agenda setting. Competences The seminar enables students to analyze the dynamics involved in the setting of the economic policy agenda.

3	Content of the Module Market structure and the incentive to innovate, competition and innovation, patent policy (optimal patent length and optimal patent breadth), patent races. Competences									
4	Students learn about the crucial role of innovation and technical progress from a microeconomic perspective. The focus is not on perfect competition via prices, but on the competition of ideas (Schumpeter's "creative destruction"). The modul analyses the role of industry structure for innovation incentives. The students should be able to understand the trade off in patent policy between setting ex ante the right incentives to innovate and the ex post deadweight welfare loss due to monopoly. The role of government in setting patent policy is explained. In the follow up semester, there is usually a seminar on the economics of innovation. In order to attend the seminar, it is a necessary condition to have attended and passed this module, because the content of this module is a prerequisite to understand the models of the seminar.									
5	Exam The n attaina	inations nodule grade reable in the mo	esults from the grad dule can be acquire nus points. Bonus p	de of a sem	ninar pape s points ir	er. Up	to 25 ritten ex	% of the to	est gr	rade cannot be

4	The labor market affects the daily lives and the welfare of every individual directly. Hence, the analysis of labor markets is of importance and interest not only to economists but to the population at large. Labor economics is a very challenging and a stimulating area in economics due to the special characteristics of the labor market. For example, different to capital workers are not commodities with fixed characteristics and make decisions about the nature of their participation in the labor market. Institutions affect the labor market much more than any other market. The aim of this module is to give an understanding of the distinctive features of labor markets and the ways in which they operate. Among other things, we will analyze labor supply, labor demand, human capital, and the role of different labor market institutions and labor market policies for wages and employment. Throughout the module, we attempt to integrate theoretical issues and empirical evidence, and to address questions of policy. The latter will concentrate on European issues. 4 Competences The aim of this module is to develop an understanding of the distinctive features of labor markets and the ways in which they operate. Among other things, we will analyze labor supply, labor demand, human capital, and the role of different labor market institutions and labor market policies for wages and employment. The students learn to interpret the implications and consequences of different labor market policies. Throughout the module, we attempt to integrate theoretical issues and empirical evidence in order to apply the theoretical models to real world problems. Also, questions of policy concentrating on European								
5	issues will be addressed. Examinations The final grade of the module is determined by the grade of the final examination. An additional academic achievement can be obtained in the form of a presentation of a research paper as part of the exercise. Up to 5 bonus points can be earned, which are then credited towards the points achieved in the final exam. The bonus points will also be credited if the final exam would not have been passed without the bonus points.

4	Contents of the module The course will consider both economic theory and advanced mathematical techniques. The first part of the course will cover continuous time dynamics (ordinary differential equations, systems of linear differential equations, the concepts of stability and phase diagrams), systems of difference equations, and chaos theory. In the second part, we will cover economic applications (e.g., closed economic dynamics, employment and inflation, etc.) of these procedures. The software R is ideally suited for solving and plotting dynamic systems; its use and knowledge will be required to solve the problem sets proposed during the course. Competences To deepen knowledge and understanding of macroeconomic theories and dynamics. To improve mathematical skills and concepts. To acquire practical skills in using the R software for computational purposes.								
5	Examinat Written ex Mid-Term	am (100%	of the final grade) graded)						
6	Type of E	xaminatio	ons						
	covering	the entire	module		Relating to in	ndividua	l courses		
7	Requirements None. However, knowledge of macroeconomic models and concepts at the principles to intermediate level is expected. We will work intensively with R software: it is not necessary to have previous experience with this software, but the willingness to learn how to use it is expected.

ര	The module deals with basic and advanced models and methods from data science. The focus is on applications of the methods in the field of economics. Using the programming language Python, numerical datasets and text data are analysed and machine learning/ deep learning models are developed. Topics include regularisation, supervised learning, classification, decision trees, random forests, unsupervised learning, k-means clustering, deep learning, neural networks, natural language processing.										
4	Competences In this module, students get to know basic and advanced models and methods from data science. The techniques are applied using the programming language Python. After successfully completing the module, students are able to understand a wide variety of methods of machine learning/ deep learning/ neural networks. They can develop models that implement procedures in Python, understand methods of natural language processing, analyse numerical datasets and text data, and understand applications of machine learning models in economics

3	This module deals with the econometric analysis of micro data. The first lectures will review the basic econometric methods and introduce the participants into the software package STATA. Afterwards, the students work on their own empirical project. As part of this project, the students review the relevant literature, identify their research question, prepare the underlying data, and empirically analyze the data by applying basic and advanced econometric methods. The results of the projects are presented to the class and documented in a term paper.											
4	Competences By the end of this course, students should be able to understand and evaluate empirical studies based on micro data and to conduct small empirical projects independently. Based on their analyses, students should learn to write a scientific paper and to present their research results to the class.

4	Contents of the module This course provides the review of empirical methods applied in a quickly growing field of financial econometrics. The course concentrates on describing and modelling stylized facts found in return and volatility time series. The important financial models (CAPM, APT) are discussed from the empirical point of view as well. Competences Participants should understand and make use of modern econometric techniques for modelling financial processes.

3	Content of the Module This graduate course brings together the latest research ideas and topics in public eco-nomics and political economy. The focus is primarily on theoretical work. The course consists of two parts. The first part covers topics in public economics such as the theory of public goods and the theory of optimal taxation. The second part addresses political economy issues such as political behavior (of voters, candidates, legislatures, interest groups, political parties, media) and political distortions (inefficient redistribution, career concerns, dynamic problems).

4	This course provides an introduction to the economic analysis of law, i.e., the application of economic methods to analysis of legal rules and institutions. It covers the areas of tort law, contract law and criminal law, property law and the Coase Theorem, intellectual property law, among others. The focus of the lectures will be primarily on theoretical work. Practice exercises will be assigned during the semester. Competences Students leave the course understanding how microeconomic theory can be used to critically evaluate law and public policy. The course should prove useful for any student interested in analyzing policy issues. It will be particularly valuable background for those students intending to specialize in public economics, political economy and economic policy.

4	Language of instruction English Content of the Module This course provides an introduction to game theory, i.e., the description of strategic behavior in situations in which the own payoff depends on the behavior of others. As such, game theory can be applied to analyze and understand strategic situation of various kinds, e.g. in employment situations, R&D, market competition, or market design but also in politics, sports, or biology. The primary focus of the course is to provide the theoretical tools to analyze such situations and enable the advanced study of strategic behavior. In exercises, we will also apply these methods to stylized strategic mostly business-related situations.

4	English Content of the Module This seminar focusses on the interplay between markets, economic policy and the public sphere. The narrative economic approach conceptualizes how shared beliefs influence collective economic behavior and economic policy. Since the media play an important role in forming and reinforcing economic narratives, their role is of particular interest. Concepts from communication science, like agenda setting, framing, news values, and journalistic quality, are applied to economic issues. The lecture part of the module introduces the students to concepts of narrative economics and public communication. In the seminar part students present their term papers on specific economic policy issues

	Das Modul befasst sich mit Theorie und Praxis der modernen Makroökonometrie. Behandelt werden zeitreihenanalytische Methoden, mit denen die dynamischen Zusammenhänge zwischen den wichtigsten makroökonomischen Indikatoren abgebildet werden können. Ziel ist es, empirisch gestützte Aussagen zu Ursache-Wirkungszusammen-hängen zu gewinnen, und die Resultate zur Beurteilung der empirischen Plausibilität von Theorien sowie zur Prognose und der Simulation von wirtschaftspolitischen Eingriffen zu nutzen.

4	Content of the Module The lecture covers the econometric analysis of individual data, such as households and firms. Students learn how to solve frequently occurring problems with using microeconomic data. Among other topics, panel data, instrumental variables, limited dependent variables and causality models are analyzed. The accompanying exercise serves the following purposes: students get an introduction to the econometric program Stata and learn how to apply it in practice. The exercise is supplemented by presentations of innovative empirical studies applying the presented methods. Competences On the one hand, this module aims at providing knowledge of the fundamental econometric models developed for typical problems associated with microeconomic datasets (individuals, households, firms). Students will gain an understanding of the basic problems associated with different datasets and variables and will be confronted with solutions in representative research papers. On the other hand, students learn how to apply these methods in practice. Participants acquire the necessary skills to conduct their own

3 Contents of the module

Note: more than one of the above courses can be credited.

These modules cover various research topics in modern econometrics. The mathematical background is extensively discussed using stochastic tools. In general, more than one lecture is taught each semester.

4 Competences

Participants gain deeper knowledge in a specific area of econometric research. They gain insight in the theoretical background and derivation of econometric procedures and are able to adapt the methods in accordance to the desired settings. Based on the deeper understanding in a certain research field, the participants learn to handle and work with unknown procedures efficiently.

5	Examinations Graded oral exam or graded written exam. The lecturer may include further requirements and the form of the examination will be announced.	necessary to attend the final exam. These requirements

4	Contents of the module Wissensentdeckung in Datenbanken liegt im Schnittbereich von Datenbanken, Maschinellem Lernen und Statistik. Es geht darum, in sehr großen Datenbeständen Muster zu finden, die gemäß einem Qualitätsmaßes bewertet werden. Je nach den Vorgaben der Benutzer und dem Qualitätsmaß unterscheidet man die Lernaufgaben • Klassifikation • Clustering • Subgruppenentdeckung • Finden häufiger Mengen und Assoziationsregeln Ausgehend von gegebenen Daten müssen in einer Folge von Vorverarbeitungsschritten die Daten für die Lösung der Lernaufgabe erstellt werden, wobei unterschiedliche Algorithmen zum Einsatz kommen. Dabei werden verschiedene Arten von Daten vorgestellt, z.B. binäre Datenbanken, Zeitreihen, zeitgestempelte Daten. Die formale Charakterisierung der Lernaufgabe und des Verfahrens muss algorithmisch so umgesetzt werden, dass sehr große Datenmassen schnell durchsucht werden, wodurch sich Approximationen an die gewünschte Lösung und heuristische Verkürzungen ergeben. In der Vorlesung werden für jede Lernaufgabe einige Algorithmen vorgestellt. Vorverarbeitungsketten werden exemplarisch anhand einiger realer Anwendungen diskutiert.

2	Language									
	English									
3	Contents									
5	The purpose of this seminar is to provide an advanced understanding of modeling and forecasting methods in energy markets, esp. concerning probabilistic forecasting. The students apply sophisticated forecasting methods to real data (e.g. electricity or natural gas prices, electricity load, wind and solar power production) using the statistical Software R. They write a report and present their findings. The focus of the seminar is placed especially on probabilistic forecasting with different applications in e.g. electricity price and electricity load or wind and solar power production forecasting. A particular attention is given to regression-based modeling methods for electricity market data. Competences The students - have an advanced understanding of forecasting concepts and techniques applied in energy markets - will use statistical software R to fit estimation and forecasting algorithms to real world data - can visualize and interpret obtained results

4	Die Veranstaltungen bieten neben einer detaillierten Analyse der grundlegenden Fragestellungen der monetären Ökonomik einen Überblick über die neueren theoretischen, politischen und empirischen Entwicklungen der wissenschaftlichen Forschung im Bereich von Geld und Währung. Im Hinblick auf die fortschreitende Globalisierung wird eine internationale Perspektive gewählt.									
	 Competences Die Studierenden verstehen die Inhalte der monetären Ökonomik auf dem aktuellen wissenschaftlichen Niveau sind in der Lage, die Methodik in eigenständigen empirischen Arbeiten, zum Beispiel im Rahmen einer Masterarbeit, anzuwenden sind durch die enge Verzahnung von Theorie und Praxis auf eine Vielzahl von Anforderungen der beruflichen Praxis vorbereitet sind durch die praktischen Übungen am PC auf eine Vielzahl von Anforderungen der beruflichen und wissenschaftlichen Praxis vorbereitet sind in der Lage, selbstständig wissenschaftliche Fragestellungen zu erörtern und zu lösen

3	Contents of the module The course provides advanced knowledge of new theoretical and empirical research in the field of international capital movements. This includes the analysis of the determinants of international capital movements, the analysis of the determining reasons of exchange rate movements as well as the analysis of the functionality of international financial markets. Furthermore, various explanatory approaches for international currency and financial crises are going to be presented and assessed.

3	Contents of the module Labor markets are of great importance for the development of modern economies. Labor market policy measures are often at the center of political and public debate. This lecture provides an insight into labor market economics and the effects of labor market policy measures. The most important theoretical and empirical concepts of labor market economists are explained. In addition, recent empirical findings are discussed and linked to the current political debate.										
4	 Competences The students learn the most important theoretical and empirical concepts of labor economics, know the current state of research in the field of labor economics, are able to analyze different aspects of labor market economic measures and to interpret and critically question scientific findings in this area.

4	Das Abfas sind dazu dem Doze gesamten weitere Th Studierend Datenaufb durch den Teilnehme werden er Competer Die Studie - kö	Contents of the module Das Abfassen der Projekt- oder Seminararbeit steht im Zentrum dieser Veranstaltung. Die Teilnehmer sind dazu aufgefordert, eigene Forschungsthemen zu entwickeln und diese dann in Kooperation mit dem Dozenten zu konkretisieren. Dabei umfasst das Spektrum möglicher Forschungsgegenstände den gesamten Bereich der sozialen Sicherung (z.B. Renten- und Gesundheitspolitik) und darüber hinaus weitere Themen wie zum Beispiel die Bildungspolitik. Während der Bearbeitungsphase durchlaufen die Studierenden sämtliche Phasen der empirischen Arbeit (Literaturrecherche und –auswertung, Datenaufbereitung und Schätzung sowie Dokumentation der Forschungsergebnisse) und werden dabei durch den Dozenten betreut. Durch die Präsentationen der eigenen Forschungsarbeiten erhalten die Feilnehmer auch einen Einblick in die Studien der jeweils anderen Studierenden. Falls notwendig verden ergänzende Methodenvorlesungen mit variablen Themen gelesen. Competences Die Studierenden - können sich kritisch mit empirischen Studien aus dem Bereich der sozialen Sicherung und Besteuerung auseinandersetzen und diese bewerten - können sich auf der Grundlage von bereits vorhandenen empirischen Studien das methodische Vorgehen erarbeiten und dieses in eigene Projektvorschläge umsetzen - können Mikrodatensätze für empirische Analysen mit Stata aufbereiten - können ökonometrische Methoden mit Stata eigenständig anwenden

5	Contents of the module Im Rahmen der Veranstaltung werden für das empirische Arbeiten mit umfangreichen Unternehmensbilanzdatensätzen besonders relevante statistische Methoden behandelt. Ausgewählte Fragen (Möglichkeiten der Insolvenzprognose, Determinanten der Investitionstätigkeit, Ausmaß der Finanzialisierung, etc.) werden unter Verwendung der dargestellten Methoden empirisch untersucht. Zu diesen Methoden gehören Regressionsansätze wie statische und dynamische Panelmodelle und Logit- //Probit-Regression, Entscheidungsbäume und Zufallswälder. Es erfolgt eine Anwendung der Methoden auf Unternehmensbilanzdaten zur vertieften Diskussion ökonomischer Fragestellungen. Competences Die Studierenden - kennen ausgewählte empirische Methoden - beherrschen den Umgang mit Unternehmensbilanzdaten - entwickeln eigenständig Strategien, um inhaltliche Fragen empirisch zu untersuchen - wenden ausgewählte empirische Methoden mit geeigneter Software eigenständig auf Unternehmensbilanzdaten an Examinations Zum Modul erfolgt eine modulbezogene Prüfung in der Gestalt einer empirischen Auswertung am PC (Prüfung vor Ort, in der Regel: 90-120 Minuten).

The students study the general Markowitz portfolio theory on optimal portfolio selection	
risk-free asset. They study problems in the application concerning estimation risk, like	
Korkie experiment and possible solutions. The theory is applied to problem in financial	and commodity
markets.	
4 Competences	
Students	
have an advanced understanding in portfolio management	
- study modern portfolio optimization methods that take uncertainty into account	
- are able to apply the portfolio theory to real problems, especially in financial ar	nd commodity
markets	
5 Examinations	00.400 :)
Final written exam on the teaching materials covered in lectures and tutorials (usually s	90-120 min.).

3 Contents of the module

Participants gain insight into recent econometric research and are familiarized at an early stage with how professional researchers present by attending several research seminar presentations. Students prepare themselves for the presentations by reading suitable seminal papers and/or working paper versions on which the presentation is based beforehand. Summaries of the seminars and a small final project relating to a selected presentation must be prepared.

Students may choose from a list of seminars at all campuses of TUD, UDE and RUB. These will mostly be an appropriate subset with statistical/econometric focus of the seminars linked at the bottom of http://rgs-econ.org/courses/.

4 Competences

The students

- gain insight into recent developments of econometric research in selected fields
- are trained in following scientific talks and are able to critically evaluate these
- are able to apply specialist and methodological knowledge obtained during their studies and from scientific talks to a particular research topic
- manage to work self-sufficiently at a scientific level under time constraints and thus are also prepared for writing seminar papers and a master thesis

5 Examinations

Students attend at least 7 presentations in economic research seminars hosted at TU Dortmund University, Ruhr University Bochum and University of Duisburg-Essen. Attendance needs to be signed by a present member of the faculty of the MSc Econometrics, or else some other faculty member of the contributing faculties. Admissible seminars will be announced at the introductory meeting. Students also may put forward their own suggestions.

A 1-2 page report must be written on each presentation. The summaries should evaluate the talk, i.e. briefly summarise the topic, explain the scientific contribution and reflect whether or not the talk was comprehensible and useful for the student. The report is due one week after the presentation.

Based on one of the talks, students will perform a small research project on their own. This might consist of coding and simulating a new statistical technique put forward in the presentation, replicating part of the empirical work, providing detailed proofs of a theoretical result, compiling a detailed literature review etc. The length of the research report is up to six pages.

The assessment of the course will be based (50% each) on the summaries and the research project. Based on the project, students give a presentation. The grade for the project is based 4:1 on the research report.

2	Languag English,	-	a German cours	e						
4	Content The aim of the course is to familiarise students with the independent evaluation of statistical data se In addition to the provision of a catalogue of basic standard procedures for data evaluation, a central learning objective is the appropriate presentation of the methodological approach and the evaluation results in verbal and written form. In order to achieve these learning goals, students have to work in small groups (three to four members) on projects for a total of 3 method complexes. The time frame each project is one to two weeks, depending on the level of difficulty. The intermediate and final res of the statistical evaluation are presented alternately by the groups. After completion of each project each student must write a short, written report in which the results achieved in the group and the methodology used are presented in an appropriate manner. Data Science Master students work on the first 3 of 5 projects. Competences Students work independently according to scientific criteria and report orally and in writing on their v Students apply statistical methods to real data sets, modify the methods if necessary and work out methods unknown to them. They derive solutions to problems and reflect on them. They work togeth in groups. They prepare and give presentations, explaining statistical methods and communicating results. They discuss their own and other methods, results and reports with others. They complete to projects within a short, given time.						luation, a central and the evaluation have to work in The time frame for ate and final results of each project, roup and the writing on their work y and work out they work together communicating
